

# Unity Game Development Bootcamp

---

## Lesson 01

Introduction to Game  
Development with Unity

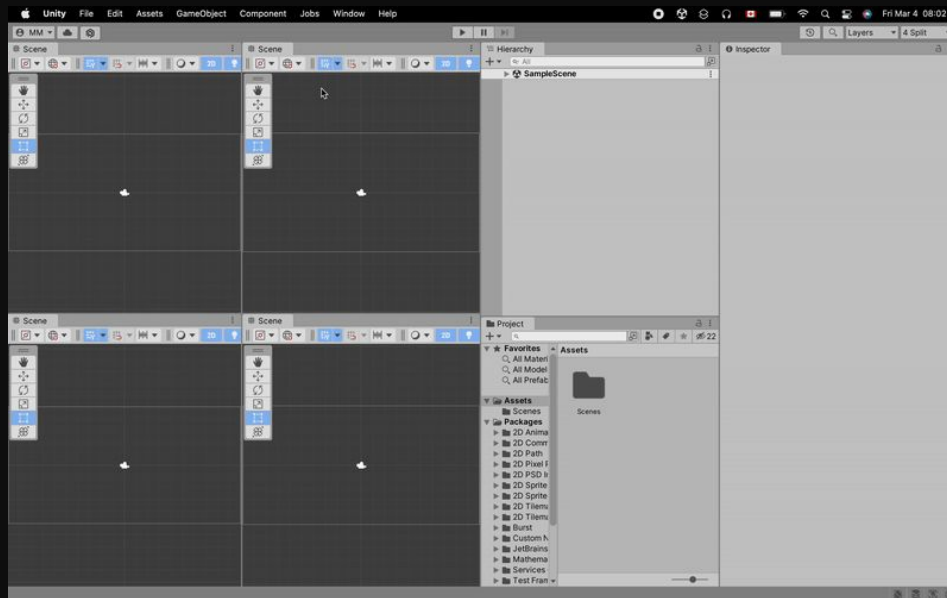

# Learning Objectives

- Handle projects and Editor versions with the Unity Hub
- Control the Unity Editor
- Interpret 2D and 3D virtual space
- Use mouse and keyboard to move in 3D space
- Create and transform primitive GameObjects
- Apply simple materials to GameObjects

## Lecture

# The Unity Editor

# GameObjects

**Every object** in your scene is a GameObject. This includes lights, cameras, characters, empty GameObjects, and everything else.

GameObjects **do not have functionality** by themselves. You need to add **components** to define behaviors.

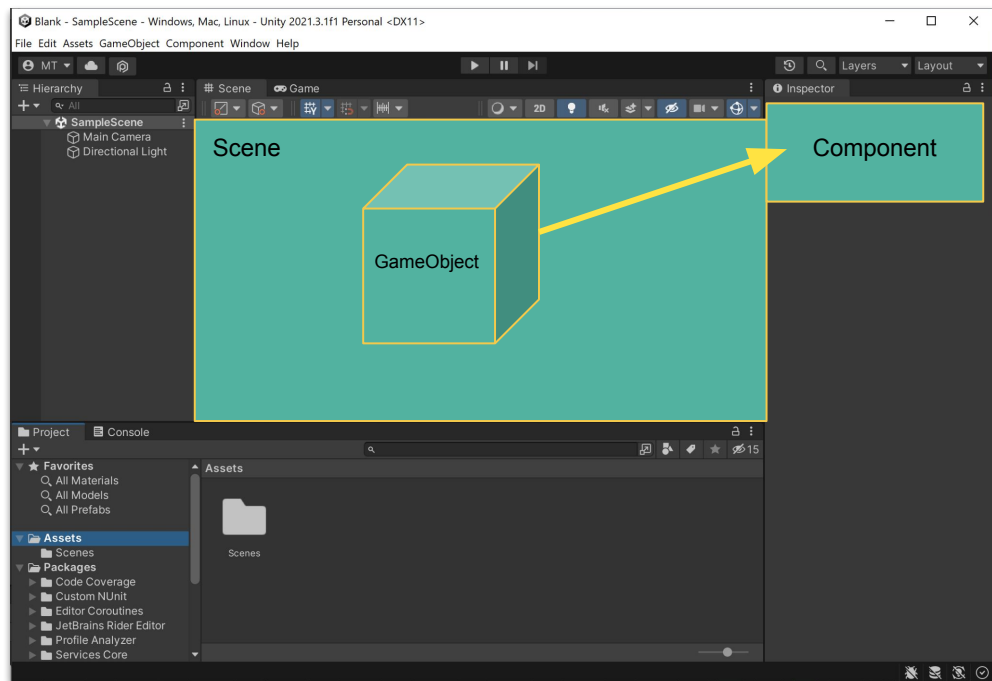

# Anatomy of a Scene

Scene

↳ GameObjects

↳ Components

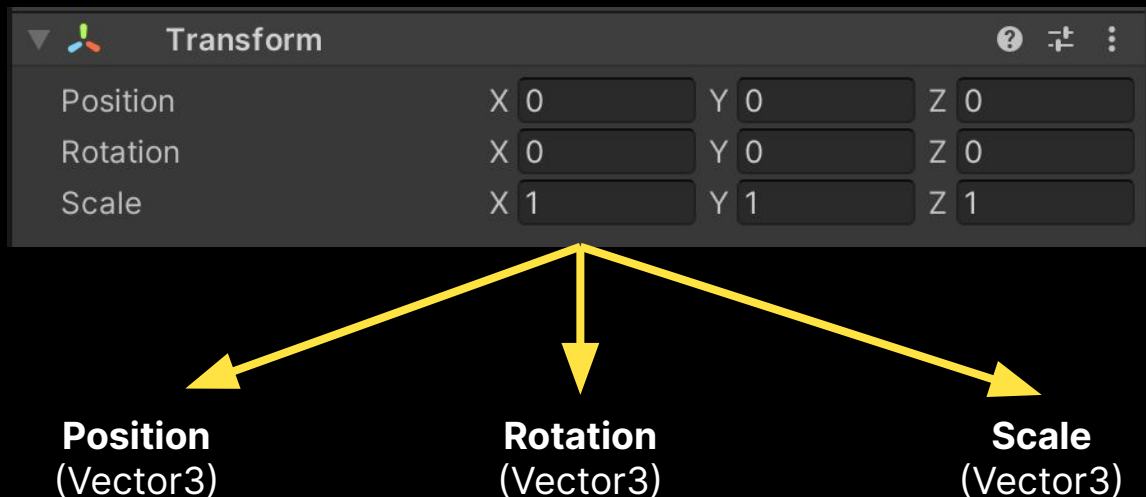

↳ Data

# Anatomy of a GameObject

# Transform Component

# Vector 3

It is a data type made up of  
**a group of three numbers.**

It is data that can be used to  
represent position, rotation, or scale

Unity measures everything with  
configurable **Unity units**, which by  
default are:

Distance: **1 Unity unit = 1 m**  
Mass: **1 Unity unit = 1 Kg**

**Lecture**

# The Unity Interface

**Lecture**

# Scene Navigation

## Challenge 01

🕒 5 mins

### Navigate the scene 1

Zoom in until you can read the text on the saw, then do a full rotation around the workbench with and without orbit.

<b>Rotate</b>	Hold <b>right-click</b> , then <b>drag</b>
<b>Move</b>	Hold <b>Alt + middle-click</b> , then <b>drag</b>
<b>Move without middle-click</b>	Hold <b>Alt CTRL left-click</b> , then <b>drag</b>
<b>Orbit</b>	Hold <b>Alt left-click</b> , then <b>drag</b>
<b>Zoom</b>	Use the <b>scroll wheel</b>
<b>Zoom without middle-click</b>	Hold <b>Alt right-click</b> , then <b>drag</b>

## Challenge 02

🕒 5 mins

### Navigate the scene 2

1. Move out and rotate around the whole scene.
2. Move in and rotate around a small object. Adjust mouse sensitivity.
3. **Pretend to build a scene:** move around, and look at all the surfaces from different perspectives. Get used to navigation.

**Move forward** Hold **right-click** **W**

**Move backward** Hold **right-click** **S**

**Move left** Hold **right-click** **A**

**Move right** Hold **right-click** **D**

**Move up** Hold **right-click** **E**

**Move down** Hold **right-click** **Q**

**Change Sensitivity** Hold **right-click**, then  
move **mouse wheel**

**Increase Speed** Hold **Shift**

**Lecture**

# GameObjects & Transforms

## Challenge 03

⌚ 5 mins

### Practice moving GameObjects

Make a cube that barely covers the whole scene using **Isometric** and **XYZ** gimbals.

Move tool W

Rotate tool E

Scale tool R

Rect tool T

Vertex snapping Hold V

Grid snapping Hold Ctrl

Toggle pivot/center Z

Toggle global/local X

**Lecture**

# 3D Space

## Challenge 04

🕒 15 mins

### Create objects

Create objects using primitive shapes. You can create:

- A table
- A chair
- A simple tree
- A door with a GameObject as a pivot point for the hinge  
Use Snap (**V**) to align the pivot

**Do not delete the objects**, you will use them for the next challenge.

**Lecture**

# Materials

# Materials

A **material** is what defines the **appearance of a surface**.

**Materials and shaders** go hand in hand. Materials refer to shaders, which are programs that run on the GPU.

Depending on which shader is used, a selection of parameters are available to modify.

## Challenge 05

🕒 15 mins

### Add simple materials to objects

Add materials to the objects you created using primitive shapes.

- A blue table
- A red chair
- A simple tree, green would be the standard here
- A brown wooden door with a yellow knob

Save these, we will use them in the next lesson.

# Project Organization

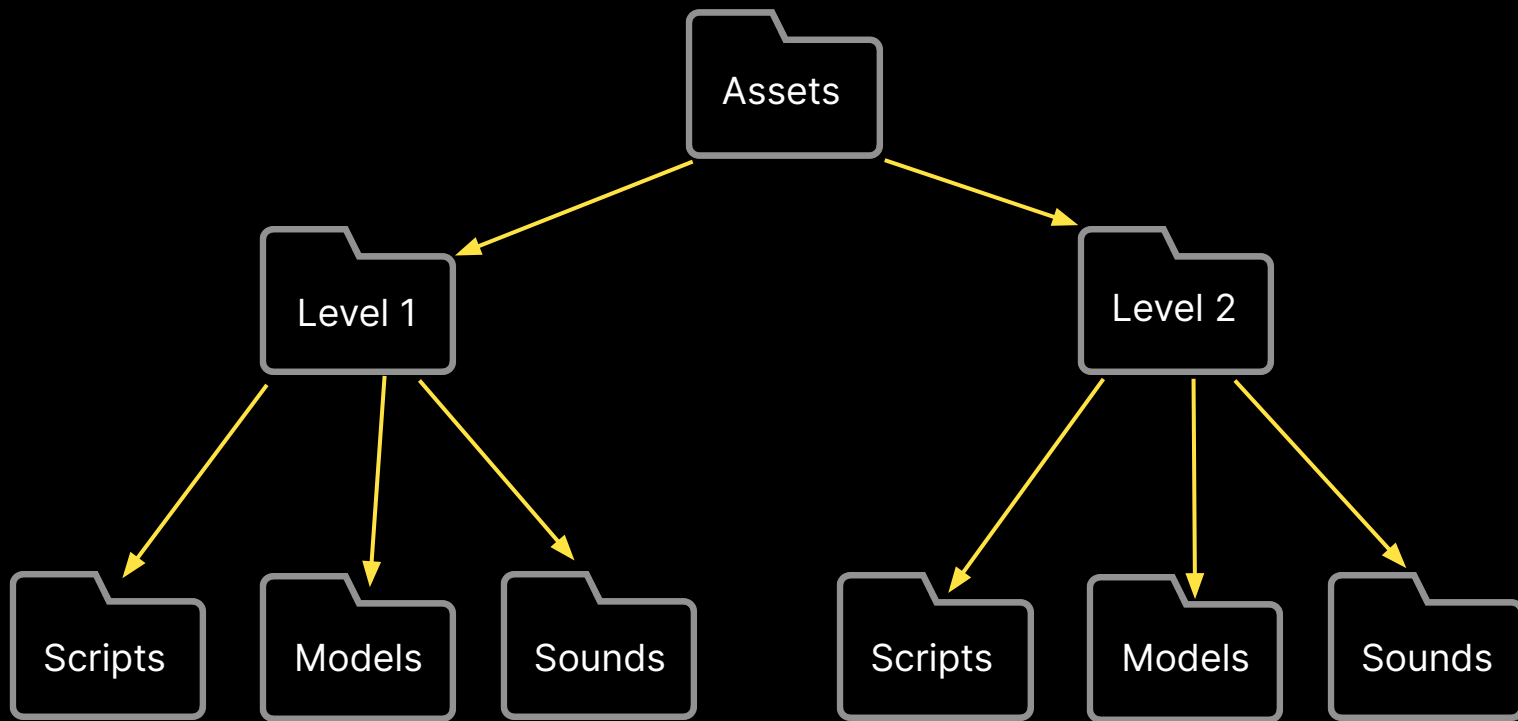

You are free to arrange your project files however you like. But it is imperative to stay organized!

Here are some recommended methods:

- Organizing by **context**
- Organizing by **type**
- Organizing by **license**

# Context

# Type

# License
